/product= "vitaxin antibody heavy chain variable region"
/note= "partial sequence, no start or stop codon given"
                                 Vitaxin; antibody; variable region; heavy chain; light chain; integrin; LM609; inhibitor; integrin-mediated signal transduction; treatment; diagnosis; angiogenesis; restenosis; inflammation; diabetic retinopathy; neovascular glaucoma; cancer; psoriasis; rheumatoid arthritis; murine; macular degeneration; osteoporosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence encodes the vitaxin antibody variable heavy chain region. Vitaxin and the antibody LM609 bind selectively to integrin alphavbeta3 and can be used to inhibit binding of alphavbeta3 to a ligand and thus block integrin-mediated signal transduction. This is useful in the treatment, prevention and diagnosis of alphavbeta3-mediated disease, specifically angiogenesis and restenosis (but also e.g. (non-)immune inflammation, diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid arthritis, macular degeneration, osteoporosis etc.). The antibodies contain non-murine framework regions so are suitable for use in humans. Enhanced types of LM609 have affinity more than 90 times greater than that of parent the parent antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CCTGTGCAGCCTCTGGATTCGCTTTCAGTAGCTATGACATGTCTTGGGTTCGCCAGATTC 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to enhanced LM609 grafted antibodies exhibiting selective binding affinity to alphaVbeta_3 integrin or their functional fragments. The antibodies or their functional fragments can be used in the diagnosis and treatment of alphaVbeta_3-mediated diseases such as angiogenesis, inflammatory diseases (such as psoriasis and chronic articular rheumatism), disorders associated with inappropriate or inopportune invasion of cancer disorders such as tumours and Kaposi's sarcoma), retinal diseases (such as macular degeneration), restenosis and

These fragments were produced by PCK using the primer sequences given in AAQ68644.48. The amplified fragments were used in the construction of vectors for the expression and secretion of the

chimeric humanised A33. The amplified products were cleaved with BstBI and SplI for the light chain and HindIII and ApaI for the heavy chain. These fragments were cloned into the human kapa light chain acceptor vector, pMRRI5.1, and the human heavy chain, IgG1, acceptor vector, pMRR011 respectively, to give chimeric expression vector pR0108 for the light chain and pR0107 for the heavy chain. Proteins which bind the A33 antigen can be used in the diagnosis or treatment of colorectal cancers and metastases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           362

The invention is directed to a novel peptide linker useful for connecting polypeptide constituents into a novel linked fusion polypeptide. The peptide linker includes at least one XP motif (where X is a charged amino acid) and includes any of these sequences (GSYSGSARCSGSGEGSTKG; GTSGSXRSGSEGSTKG; or GSTSGKSEGKG) to inhibit its proteolysis by subtilisin or trypsin. DNA molecules encoding fusion polypeptides, containing two polypeptides, derived from the same multichain protein of the immunoglobulin (1g) superfamily and a peptide linker as above, are particularly useful for diagnosis and treatment of cancer. The fusion polypeptide containing the specified linkers is proteolytically stable sassociated with positioning of the P residue's minoraction, while residue X improves solubility. The present sequence represents the nucleotide sequence of a A33/212 scfv fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                120

                                                                                                                                                                                                                                                                                                                                                                                                       for connecting
                                                                                                                                                                                                                                                                                                                                                                                       This sequence encodes a linked fusion protein containing the amino acid linker of the invention. The linkers are used for connecting constituent polypeptides to form novel linked fusion polypeptides. Polypeptides derived from any protein can be connected, in particular multichain protein or protein complexes e.g. enzymes, members of the immunoglobulin superfamily, hormones, DNA-binding proteins. The linker provides fusion proteins which have greater stability and are less

NAME OF COLOR OF A PART OF COLOR OF COL

```
The invention is directed to a novel peptide linker useful for connecting polypeptide constituents into a novel linked fusion polypeptide. The peptide linker includes at least one XP motif (where X is a charged amino acid) and includes any of these sequences (GSTSGSARGSGSGEGTKG; GTSGSXRSGSGEGTKG; CTSGSXRSGSGEGTKG; CTSGSXRSGGGTKG; OT GTSGKSEGKG) to inhibit its proteolysis by subtilisin or trypsin. DNA molecules encoding fusion polypeptides containing two polypeptides, derived from the same multichain protein of the immunoglobulin (1g) superfamily and a peptide linker as above, are particularly useful for diagnosis and treatment of cancer. The fusion polypeptide containing the specified linkers is proteolytically stable associated with positioning of the presidue; and resistant to aggregation, while residue X improves solubility. The present sequence represents the nucleotide sequence of a A33/218 scFv fragment.
                                                                                                                                                                                                                                     Linker; fusion polypeptide; proteolysis; subtilisin; trypsin; scFV; multichain protein; immunoglobulin; single chain antibody FV; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A encoding fusion polypeptide including protease resistant linker for making single-chain Fv antibody fragments, e.g for diagnosis

The linkers are used for connecting constituent polypeptides to form novel linked fusion polypeptides. Polypeptides derived from any protein can be connected, in particular multichain protein or protein complexes e.g. enzymes, members of the immunoglobulin superfamily, hormones, DNA-binding proteins. The linker provides fusion proteins which have greater stability and are less susceptible to aggregation.
                                                                                                                                                                                                                                                                                                                                                                       protein; linker; linked fusion polypeptide; multichain protein;

                                                                                                                                                                                                           ;;
                                    (RFB4 IgG) heavy chain variable region DNA sequence. The invention claims for a recombinant immunoconjugate comprising of a therapeutic agent (e.g. pseudomonas exotoxin) or a detectable label peptide bonded to a recombinant anti-CD22 antibody hing a variable heavy (VH; AAW66099) chain with a cysteine residue at amino acid 44 and a variable light (VL; AAW66098) chain with a cysteine residue at amino acid 100. The immunoconjugate is claimed to inhibit the growth of malignant B-cells in vivo, such as rodent, canine or primate B-cells. The anti-CD22 antibody is claimed useful for detecting CD22 protein in a sample or in vivo in a mammal, and can be used in diagnostic kits.

This DNA sequence codes for murine A33 chimeric receptor (see AAW73048) comprising a signal peptide from the Vkappa chain of human antibody 98-6. light chain and heavy chain variable regions of antibody 98-6. light chain and heavy chain variable regions of antibody 98-6. light chain and heavy chain variable regions of antibody 93. human colon cancer antigen A33 murine monoclonal antibody A33, human cg2 constant domain and M1 segment, human CD4 transmembrane domain cg6 constant domain portion of human TCR-associated zeta chain. A humanised version of the A33 chimeric proteins, and DNA encoding them, are constructed manner, a transmembrane domain and a cytoplasmic domain capable of binding to A33 in a non-MHC restricted manner, a transmembrane domain and a cytoplasmic domain capable of activating a signalling pathway. Binding of A33 to the extracellular domain results in transduction of a signal and a cytoplasmic domain capable of activating a signalling pathway in the cell, such that the cell may be induced to carry out various functions relating to the signalling pathway in the cell, such that the cell may be induced to carry out various functions relating to the signalling pathway in the cell, such that the cell captuation of a signalling pathway in the cell, such that the cell may be induced to carry out various functions relating to the ceptically as abone marrow transplant) into a mammal to provide a source of cytotoxic effector cells that can kill cells captually as the modified cells are activated in presence of A33+ cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           687

Subsequent cloning using PCR primers JO20, JO21, JO22 and JO24 (see AAQ62759-Q62762) resulted in the isolation of the mouse Igvariable domains. The amplified cDNAs were sequenced (AAQ62763 and AAQ62764). Chimeric mouse-human antibodies were constructed
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunoglobulin variable domain; primer; polymerase chain reaction; chimeric antibody; human milk fat globule; human breast carcinoma; murine anti-human carcinoma monoclonal antibody KC-4; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chimeric human-murine polypeptide(s) specific for human mammary fat globule antigen - for imaging, diagnosing and treating neoplasia, with less undesirable immunogenic response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              using human constant regions so as to produce less immunogenic polypeptides which retained the anti-human carcinoma binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          a
"KC-4 VH chain (no termination codon)"

                                                                                                                                                                                                                                                                              New antibodies have been developed which are specific for human parathormone related peptides (hPTRP). The antibodies comprise chimeric L and/or H chains, where the C region is of human and L region of mouse, origin. The present sequence encodes a specifically claimed region of an antibody of the invention. Host cells, transformed with vectors containing DNA encoding antibodies of the invention, can be used to produce the antibodies. The antibodies may be used to treat hypercalcaemia, especially that due to a malignancy, e.g. cancers of pancreas, lung, throat, larynx, tongue, gum, ossophagus, stomach, liver, breast, kidney, bladder, womb or prostate or malignant lymphoma. They may also be used for treatment of hypophosphaemia such as that due to

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 17,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query
